PlaceIn

Head-Office Management Platform

Developer Screen Plan | Revised 24-screen scope | 8 October 2026

This is the central web platform for managing PlaceIn across all countries and agencies. It is separate from the 22-screen agency portal.

PlaceIn earns revenue from monthly agency fees. Property seekers use the app free of charge. Property transactions happen outside PlaceIn, and PlaceIn does not charge commission.

The platform will have 24 main screens. Tabs, forms, pop-ups and error states sit within these screens. This document defines the screen scope; detailed implementation specifications and mockups follow this plan.

Access permissions

Use one staff sign-in system with three roles. Each staff member should have an individual account.

Role	Access
Maintenance / tech	Platform health, technical support issues, upload failures and authorised technical settings. No access to revenue, invoices, payment records or billing exports.
Admin / support	Agency onboarding, agents, listings, moderation, user support, enquiries and appointments. Financial access disabled by default; additional permissions controlled by super admin.
Super admin	All sections, financial records, settings, staff permissions and audit history.

Permissions must be enforced by the backend for pages, actions, records and exports. Hiding navigation alone is insufficient. No separate dashboard design is needed for each role.

Screens 01-04

Main screens and required behaviour

01 Overall dashboard

Separate summaries for paying agencies and free property seekers. Show active agencies, agent accounts, available listings, new uploads, properties reported sold or let, downloads, registered users, active users, enquiries, offers and appointments. Show subscription revenue, paid invoices, overdue balances and failed payments to authorised users. Include date and country filters, comparison periods and links to detailed sections.

02 Agencies directory

Search and filter agencies by name, country, verification, account status, plan and payment status. Show agent count, available properties, joining date and last activity. Open each agency's profile. Support invitations, onboarding review and account-status changes with a recorded reason.

03 Agency profile and performance

Tabs for overview, agents, projects, properties, media, leads, appointments, reported outcomes, subscription, invoices and activity history. Show agency contact details, verification, account allowances and usage. Display performance for the selected period. Financial tabs follow permissions.

04 Agents directory

Search individual agents across agencies. Show agency membership, role, assigned projects, property count, account status and last activity. Filter by country, agency and status. An agent's access must remain scoped to their agency membership.

Screens 05-08

Main screens and required behaviour

05 Agent profile and performance

Show agency membership, permissions, assigned projects and properties, enquiries, response times, appointments and reported outcomes. Include activity history and account-support actions. Allow authorised reassignment when an agent leaves. Never display passwords.

06 Properties directory

Search all properties by reference, location, agency and agent. Filter by country, sale/rental type, publication state and property status. Show available, under offer, sold, let, withdrawn and expired properties. Display upload date, media-quality result and assigned agent.

07 Property details and activity

Show listing information, price and currency, location, agency, assigned agent, media and quality results. Include views, unique viewers, saves, enquiries, offers and appointments. Record publication and property-status changes with actor, date and reason. Support correction requests and moderated removal.

08 Reported property outcomes

Report properties marked sold, let or withdrawn, including status date, time advertised and reporting agency. Where supplied, show whether the agency or user attributes the lead to PlaceIn. Support corrections and relisting history. These are reported outcomes, not verified transactions or commission records.

Screens 09-12

Main screens and required behaviour

09 Reels and videos

List reels and property walkthroughs with agency, agent, linked property, upload date, processing state, quality result and publication state. Show plays, unique viewers, watch time, completion, likes, saves and resulting enquiries. Reel editing remains in the mobile app.

10 Approvals and moderation

Separate queues for agency verification, content review, quality failures, user reports and appeals. Show the reason, priority, reviewer and decision history. Allow approval, correction requests, rejection and takedown with reasons. Hard technical failures must be resolved before publication.

11 Free users directory

Show registered property seekers separately from agencies and agents. Search and filter by country, registration date, account status and last activity. Show total accounts and filtered counts. Use server-side search, filtering and pagination so the directory works at one million users. Include authorised account-support and deletion-request actions.

12 User profile and activity

Show permitted profile details, registration date, last activity and recorded active usage. Include enquiries, submitted offers, contact actions and appointments, with linked properties and agencies. Restrict personal activity to authorised roles and the stated privacy policy. No invoices or subscriptions for these users.

Screens 13-16

Main screens and required behaviour

13 Buyer activity and offers

Show users who have enquired, submitted an offer, requested contact or booked an appointment. Offer records include property, agency, user, amount, currency, date and status: submitted, acknowledged, accepted, declined or withdrawn. An accepted offer must not automatically mark a property sold. Show reported purchase outcomes separately and leave unreported outcomes unknown.

14 Enquiries and connections

Track enquiry source, property or reel, customer, agency, assigned agent, channel, creation time, response time and follow-up status. Distinguish contact-button taps, call requests and conversations started. Show unanswered and unassigned leads. Do not expose private message contents in general reporting views.

15 Appointments overview

Show viewings, video calls and office appointments across agencies. Filter by date, country, agency, agent, property and status. Include requested, confirmed, reschedule proposed, completed, cancelled and no-show states. Display relevant time zones clearly. Record booking changes and prevent scheduling conflicts in the agency booking system.

16 App usage and audience analytics

Show app downloads by platform, registrations, unique users who logged in, guest usage, daily/weekly/monthly active users, new and returning users, sessions, active session duration, visit frequency and retention. Include property views, reel plays, watch time, completion, follows, likes, saves, enquiries, offers and bookings. Display metric definitions, source and last update.

Screens 17-20

Main screens and required behaviour

17 Country and regional performance

Compare users, active usage, agencies, agents, listings, enquiries, offers, appointments and reported outcomes by country. Distinguish the user's country from the country where they are searching for property. Show subscription income to authorised roles, with an explicit reporting currency and conversion basis.

18 Agency subscription management

Manage configurable monthly plans, trials, agent/listing allowances, subscription start, renewal, cancellation and account eligibility. Record plan changes and effective dates. Define what happens at trial expiry and when payment becomes overdue. Free users remain outside this billing system.

19 Monthly payments and overdue accounts

Show invoices by agency and billing month, amount, currency, due date, amount paid and outstanding balance. Support paid, unpaid, partially paid, overdue, void and refunded invoice states, plus failed payment attempts. Include receipts, reminders, retries and authorised adjustments. Payment-provider records must determine payment status.

20 Support tickets

Handle agency and free-user issues. Include category, priority, assigned staff member, linked records, attachments, customer replies, internal notes and status history. Route technical issues to maintenance staff. Clearly separate internal notes from messages sent to customers.

Screens 21-24

Main screens and required behaviour

21 Staff access and audit history

Create individual staff accounts and assign the three agreed roles. Super admin controls permissions, invitations and access removal. Include two-factor authentication and session revocation. Audit sensitive access, account changes, moderation decisions, billing changes and exports.

22 Platform settings

Configure countries, languages, currencies, time zones, media policies, notifications, privacy controls and integrations. Restrict billing rules to authorised roles. Record configuration changes and their effective dates. Policy changes must not silently remove existing content.

23 Notifications and announcements

Manage templates and delivery for enquiries, appointments, approvals, upload failures, invoices and payment reminders. Support push, email and in-app channels where integrated. Include audience selection, preferences, delivery failures and announcement history. Preview messages before sending.

24 Platform health

Show service availability, app errors, failed uploads, media-processing queues, integration failures and backup/recovery status. Filter by platform, app version, severity and time. Link incidents to technical support tickets. Keep financial data and sensitive customer details out of technical logs.

Shared platform requirements

Property states

Separate listing publication from property outcome. A listing can be unpublished while its property remains available. Keep an audit trail when properties are marked sold, let, withdrawn or relisted.

Agency separation and ownership

One agency must never access another agency's records. Define what happens to properties, leads and appointments when an agent leaves or an agency account is restricted.

Supporting interface states

Provide loading, empty, error, validation, confirmation and permission-denied states. Apply the same permissions to exports as to on-screen records.

Localisation and reporting

Use country-aware dates, time zones and currencies. Show the reporting period and last update on analytics pages.

Design and implementation handover

Use the existing PlaceIn navy, gold and white branding. The head-office header must clearly distinguish this platform from the agency portal.

Per-screen specification

For each screen, the development specification must include its layout, fields, filters, permitted actions, data sources, status rules, supporting states and acceptance criteria.

Connected products

Developers must connect the relevant events and features in the consumer app and agency portal. Head-office screens alone cannot generate those records.

Mockup sequence

This is the revised 24-screen scope. Screen 1 will be designed against this plan, and subsequent screens will be shown one at a time in numbered order.

Measurement and app connections

Downloads

Import supported App Store and Google Play reports. Keep downloads separate from registered accounts and active users.

Logged-in users

Count unique authenticated users during the selected period; distinguish this from the number of login events.

Active users

Define qualifying activity consistently. Identify registered users separately from estimated guest users.

Time spent

Measure foreground, active usage with inactivity handling. Do not count time when the app is left open in the background.

Views and engagement

Define view/play thresholds, deduplicate retries and exclude internal previews and known automated traffic.

Calls

Record contact taps and call requests. Only label a call completed if a supported integration or explicit report confirms it.

Offers

Requires an offer-submission flow in the consumer app and an agency response flow in the agency portal.

Sold and let outcomes

Require agency status updates, reporting dates and correction history. A sale happens outside PlaceIn.

Payments

Integrate the selected payment provider and invoice system, including failed payments, retries and reconciliation.
